

Amazon Return Pick-up Issues provides guidance for customers experiencing problems with scheduled return pickups and explains how to manage failed pickups, cancel return requests, and reschedule pickups. Customers can view this information in their preferred language by selecting the desired language from the country flag menu displayed on the top banner. The status of a return pickup request can be accessed by visiting the Your Returns section of the Amazon account.

Before a return pickup is attempted, customers should ensure that the product is in its original condition. The item should include the original MRP or price tag, user manual, warranty card, all accessories supplied with the product, and the return label if one is required. Customers can manage their return requests through the Returns Centre.

A return pickup may fail for several reasons. If the customer is unavailable during the scheduled pickup slot, the delivery agent will attempt to contact the customer by phone and arrange another pickup. Up to three pickup attempts will be made. If all three attempts are unsuccessful because the customer remains unavailable, the pickup request will be cancelled. A pickup may also fail if product verification is unsuccessful. During pickup, the delivery agent verifies that the returned product matches the return request and is in its original condition. If the item has been used, is missing the MRP or price tag, lacks accessories, or otherwise fails the verification process, the delivery agent may cancel the pickup request. In some cases, Amazon may cancel the return pickup due to operational reasons that prevent the pickup from being completed. A pickup may also fail if the delivery address is inaccessible or located outside Amazon's serviceable area. Additionally, pickups cannot be completed when the address provided by the customer is incomplete or incorrect. Pickup requests may also fail because of uninstallation or packaging issues when the product has not been properly uninstalled or packaged according to Amazon's return requirements.

If a return pickup request fails, customers can submit a new pickup request after ensuring that the product is in its original condition with the MRP or price tag intact and that they will be available during the scheduled pickup window. To create a new return pickup request, customers should open the Online Returns Centre, select the item that was scheduled for return, and, if the return request has already been approved, choose View Return/Refund Status. Customers should then select Manage Return, where options are available to reschedule the pickup, modify the return request, or decide not to return the product. On the following page, customers should select Cancel Return to cancel the active return request. After the existing return request has been cancelled, a new pickup request can be created through the Online Returns Centre. Customers requiring additional guidance for scheduling a new return can refer to the How to Schedule a Return help page. If the original order was not eligible for Amazon pickup and the customer has already shipped the item using the Self-Ship return option, the return request cannot be cancelled after the item has been shipped.
